## Agilent 11713B/C <br> Attenuator/Switch Drivers

## Configuration Guide

This configuration guide will assist you through the process of configuring a switching system using the Agilent 11713B/C attenuator/switch drivers.

## Key Features

The 11713B attenuator/switch driver is a GPIB compatible instrument that concurrently drives up to two four-section programmable step attenuators and two microwave coaxial switches, or up to 10 SPDT switches ${ }^{2}$. The 11713 B is fully backward compatible with the 11713A in terms of functionality and fit. Connectivity using USB and LAN are optional.

The 11713C attenuator/switch driver is a GPIB/USB/LAN compatible instrument that concurrently drives up to four programmable step attenuators and four microwave coaxial switches, or up to 20 SPDT switches ${ }^{2}$. The 11713C comes with tri-voltage selection of $5 \mathrm{~V}, 15 \mathrm{~V}$ and 24 V and also permits user-defined voltage supply capability.

- Programming via GPIB/USB can be accomplished in simple one-line statements.
- Control the attenuator/switch drivers through LAN using a web-based interface.
- An integrated LCD display eases menu selection and instrument configuration.
- Inclusion of solenoid arc suppression diodes with three pre-defined common terminal supplies allow the instrument to be used with wide variety of attenuators and switches.

| Key features | 11713B | $11713 C$ |
| :---: | :---: | :---: |
| Manually-controlled using front panel push buttons | Yes | Yes |

| TTL control | No | Yes |

Note 1: $11713 B / C$ attenuator/switch drivers output continuous current and do not support pulse drive. Please ensure your switching devices can withstand continuous current or have a built-in current interrupt feature.
Note 2: The amount of switches and attenuators that can be driven will depend on the type of switch configuration and attenuator section configuration. The 11713C can drive twice as many devices as the 11713B; however, the total load current that can be consumed is still 1.7 A .

## Specifications

## Drive power supply specifications

Specifications below describe warranted performance over the temperature range of 0 to $50^{\circ} \mathrm{C}$ after one hour of continuous operation, unless
otherwise noted.

| Voltage | $+24 \pm 8 \% \mathrm{Vdc}$ |
| :--- | :--- |
|  | $+5 \pm 5 \% \mathrm{Vdc}$ |
|  | $+15 \pm 12 \% \mathrm{Vdc}$ |
| Current | 1.7 A maximum continuous current |
|  | Contact pairs 1 through 8,9 and 0, maximum current of 0.7 A per contact |

## Supplemental characteristics

Supplemental characteristics are intended to provide useful information and are typical but non-warranted performance parameters.

| Power | 100 or 240 Vac, autommatic selection, $50 / 60 \mathrm{~Hz}$ |
| :--- | :--- |
|  | 100 VA maximum |
| Response time | $100 \mu \mathrm{~s}$ maximum for contact pairs 1 through 8 |
|  | 20 ms maximum for contact pairs 9 and 0 |
| Driver life | $2,000,000$ switchings at 0.7 A for contact pairs 9 and 0 |
| Maximum load inductance | 500 mH |
| Maximum load capacitance | $<0.01 \mu \mathrm{~F}$ for contact pairs 9 and 0 |

## Product Configurations

The 11713B/C attenuator/switch drivers can be configured easily. The connection between the driver and switching devices is intuitive and direct. Simply select the appropriate interface cable and you can make point-to-point connection from the driver to the attenuator(s) and/or switch(es). Details such as pin numbers and wires color are provided in the tables found in Configuration Information for Switches and Configuration Information for Attenuators sections.
Note 1: The maximum quantity orderable for each cable option is 9.

Five Simple Steps to Configure your Switching System

## 1. Determine the switching device's model and option (DC connector).

## Example

| Model: | $\mathbf{8 7 1 0 4 A}$ (SP4T switch) |
| :--- | :--- |
| Option: | $\mathbf{1 0 0}$ (solder terminal) |

2. Determine the attenuator/switch driver's model and option (interface cable).

Example
Model: 11713B
Option: $\quad 201$ (Viking connector to 12-pin conductor cable, bare wire)
3 Use the selection guide, Table A (page 11) for switches and Table B (page 12) for attenuators, to determine which configuration table to use for further reference.
Example
$\begin{array}{ll}\text { Selection guide: } & \text { Table A (for switches) } \\ \text { Configuration table: } & \text { Table F-1 }\end{array}$

1. Refer to Table C-2 if a cable with banana jacks is used to make a connection between 8761A/B and 11713B/C.
2. N1810UL/TL, N1811TL and N1812UL cannot withstand continuous current. Option 403 (current interrupt) is required to protect the switches from damage due to overheating.
3. $8765 \mathrm{~A} / \mathrm{B} / \mathrm{C} / \mathrm{D} / \mathrm{F}$ require continuous current to latch. The number of switches for connection depends on option selection.

Note 1: Each table below illustrates the configuration of one switch to the 11713B/C.
Note 2: For switches with Option 161, ground pin 16 opens all paths. Use S9 for Attenuator X or S0 for Attenuator Y.*

* Do not close any path and ground pin 16 simultaneously as this makes the switch buzz.

Note 3: For switches with Option 100, there are no solder terminals available to open all paths.
Note 4: Solder terminal/DIP connector with pin numbers 6, 8, 12 \& 14 provides indicator function.
Note 5: Applies to both Option 024 (standard/non-TTL drive) and Option T24 (TTL drive).
Note 6: One additional switch can be driven by Attenuator $Y$ (front panel pushbuttons 5, 6, $7 \& 8$ ) using the same configuration as Attenuator $X$.

Note 1: Each table below illustrates the configuration of one switch to the 11713B/C.
Note 2: For switches with Option 161, ground pin 16 opens all paths. Use S9 for Attenuator X or S0 for Attenuator Y.*

* Do not close any path and ground pin 16 simultaneously as this makes the switch to buzz.

Note 3: For switch with Option 100, no solder terminal available to open all paths.
Note 4: Applies to both Option 024 (standard/non-TTL drive) and Option T24 (TTL drive).
