

DS1232

MicroMonitor Chip

Description

The DS1232 MicroMonitor™ Chip monitors three vital conditions for a microprocessor: power supply, software execution, and external override. First, a precision temperature-compensated reference and comparator circuit monitors the status of V_{CC} . When an out-of-tolerance condition occurs, an internal power fail signal is generated which forces reset to the active state. When V_{CC} returns to an in-tolerance condition, the reset signals are kept in the active state for a minimum of 250ms to allow the power supply and processor to stabilize.

Key Features

- Halts and restarts an out-of-control microprocessor
- Holds microprocessor in check during power transients
- Automatically restarts microprocessor after power failure
- Monitors pushbutton for external override
- Accurate 5% or 10% microprocessor power supply monitoring
- Eliminates the need for discrete components
- Space-saving, 8-pin mini-DIP
- Optional 16-pin SOIC surface mount package
- Industrial temperature -40°C to +85°C available, designated N

Key Specifications: Supervisors (1 Monitored Voltage)

PIN ASSIGNMENT

DS1232 8-Pin DIP (300-mil)
See Mech. Drawings Section

DS1232S 16-Pin SOIC (300-mil)
See Mech. Drawings Section

PIN DESCRIPTION

PBRST	- Pushbutton Reset Input
TD	- Time Delay Set
TOL	- Selects 5% or 10% V _{CC} Detect
GND	- Ground
RST	- Reset Output (Active High)
RST	- Reset Output (Active Low, open drain)
ST	- Strobe Input
V _{CC}	- +5 Volt Power
NC	- No Connections

DESCRIPTION

The DS1232 MicroMonitor™ Chip monitors three vital conditions for a microprocessor: power supply, software execution, and external override. First, a precision temperature-compensated reference and comparator circuit monitors the status of V_{CC}. When an out-of-tolerance condition occurs, an internal power fail signal is generated which forces reset to the active state. When V_{CC} returns to an in-tolerance condition, the reset signals are kept in the active state for a minimum of 250 ms to allow the power supply and processor to stabilize.

The second function the DS1232 performs is pushbutton reset control. The DS1232 debounces the pushbutton input and guarantees an active reset pulse width of 250 ms minimum. The third function is a watchdog timer. The DS1232 has an internal timer that forces the reset signals to the active state if the strobe input is not driven low prior to timeout. The watchdog timer function can be set to operate on timeout settings of approximately 150 ms, 600 ms, and 1.2 seconds.

OPERATION - POWER MONITOR

The DS1232 detects out-of-tolerance power supply conditions and warns a processor-based system of impending power failure. When V_{CC} falls below a preset level as defined by TOL (Pin 3), the V_{CC} comparator outputs the signals RST (Pin 5) and $\overline{\text{RST}}$ (Pin 6). When TOL is connected to ground, the RST and $\overline{\text{RST}}$ signals become active as V_{CC} falls below 4.75 volts. When TOL is connected to V_{CC} , the RST and $\overline{\text{RST}}$ signals become active as V_{CC} falls below 4.5 volts. The RST and $\overline{\text{RST}}$ are excellent control signals for a microprocessor, as processing is stopped at the last possible moments of valid V_{CC} . On power-up, RST and $\overline{\text{RST}}$ are kept active for a minimum of 250 ms to allow the power supply and processor to stabilize.

OPERATION - PUSHBUTTON RESET

The DS1232 provides an input pin for direct connection to a pushbutton (Figure 2). The pushbutton reset input requires an active low signal. Internally, this input is debounced and timed such that RST and $\overline{\text{RST}}$ signals of at least 250 ms minimum are generated. The 250 ms delay starts as the pushbutton reset input is released from low level.

OPERATION - WATCHDOG TIMER

A watchdog timer function forces RST and $\overline{\text{RST}}$ signals to the active state when the $\overline{\text{ST}}$ input is not stimulated for a predetermined time period. The time period is set by the TD input to be typically 150 ms with TD connected to ground, 600 ms with TD left unconnected, and 1.2 seconds with $\overline{\text{TD}}$ connected to V_{CC} . The watchdog timer starts timing out from the set time period as soon as RST and $\overline{\text{RST}}$ are inactive. If a high-to-low transition occurs on the $\overline{\text{ST}}$ input pin prior to timeout, the watchdog timer is reset and begins to timeout again. If the watchdog timer is allowed to timeout, then the RST and $\overline{\text{RST}}$ signals are driven to the active state for 250 ms minimum. The $\overline{\text{ST}}$ input can be derived from microprocessor address signals, data signals, and/or control signals. When the microprocessor is functioning normally, these signals would, as a matter of routine, cause the watchdog to be reset prior to timeout. To guarantee that the watchdog timer does not timeout, a high-to-low transition must occur at or less than the minimum shown in Table 1. A typical circuit example is shown in Figure 3.

ABSOLUTE MAXIMUM RATINGS*

Voltage on V _{CC} Pin Relative to Ground	-0.5V to +7.0V
Voltage on I/O Relative to Ground	-0.5V to V _{CC} + 0.5V
Operating Temperature	0°C to 70°C
Operating Temperature (Industrial Version)	-40°C to +85°C
Storage Temperature	-55°C to +125°C
Soldering Temperature	260°C for 10 seconds

* This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operation sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods of time may affect reliability.

RECOMMENDED DC OPERATING CONDITIONS (0°C to 70°C)

PARAMETER	SYMBOL	MIN	TYP	MAX	UNITS	NOTES
Supply Voltage	V _{CC}	4.5	5.0	5.5	V	1
$\overline{\text{ST}}$ and $\overline{\text{PBRST}}$ Input High Level	V _{IH}	2.0		V _{CC} +0.3	V	1
$\overline{\text{ST}}$ and $\overline{\text{PBRST}}$ Input Low Level	V _{IL}	-0.3		+0.8	V	1

DC ELECTRICAL CHARACTERISTICS (0°C to 70°C; V_{CC}=4.5 to 5.5V)

PARAMETER	SYMBOL	MIN	TYP	MAX	UNITS	NOTES
Input Leakage	I _{IL}	-1.0		+1.0	μA	3
Output Current @ 2.4V	I _{OH}	-8	-10		mA	5
Output Current @ 0.4V	I _{OL}	8	10		mA	
Low Level @ RST	V _{OL}			0.4	V	1
Output Voltage @ -500 μA	V _{OH}	V _{CC} -0.5V	V _{CC} -0.1V		V	1, 7
Operating Current	I _{CC}		0.5	2.0	mA	2
V _{CC} Trip Point (TOL=GND)	V _{CC} TP	4.50	4.62	4.74	V	1
V _{CC} Trip Point (TOL=V _{CC})	V _{CC} TP	4.25	4.37	4.49	V	1

CAPACITANCE (t_A=25°C)

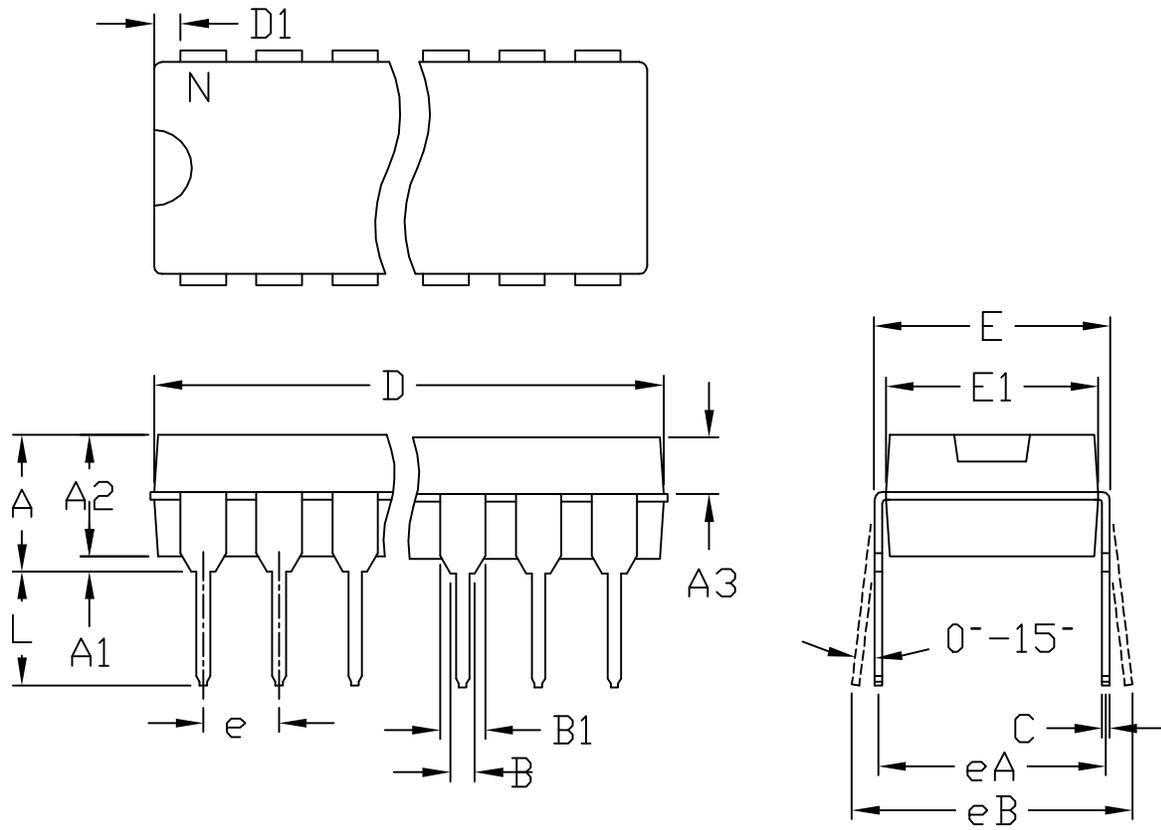

PARAMETER	SYMBOL	MIN	TYP	MAX	UNITS	NOTES
Input Capacitance	C _{IN}			5	pF	
Output Capacitance	C _{OUT}			7	pF	

AC ELECTRICAL CHARACTERISTICS (0°C to 70°C; $V_{CC}=5V \pm 10\%$)

PARAMETER	SYMBOL	MIN	TYP	MAX	UNITS	NOTES
$\overline{PBRST} = V_{IL}$	t_{PB}	20			ms	
RESET Active Time	t_{RST}	250	610	1000	ms	
\overline{ST} Pulse Width	t_{ST}	20			ns	6, 8
V_{CC} Fail Detect to RST and \overline{RST}	t_{RPD}		100	175	μ s	
V_{CC} Slew Rate 4.75V to 4.25V	t_F	300			μ s	
V_{CC} Detect to RST and \overline{RST} Transition	t_{RPU}	250	610	1000	ms	4
V_{CC} Slew Rate 4.25V to 4.75V	t_R	0	5		μ s	
\overline{PBRST} Stable Low to RST and \overline{RST}	t_{PDLY}			20	ms	

NOTES:

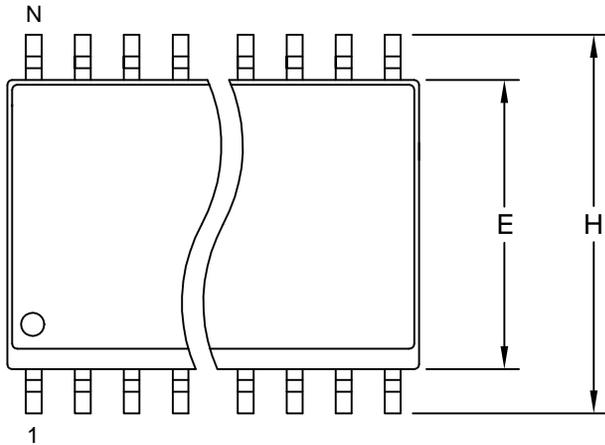

- All voltages referenced to ground.
- Measured with outputs open.
- \overline{PBRST} is internally pulled up to V_{CC} with an internal impedance of 10k typical.
- $t_R = 5 \mu$ s.
- \overline{RST} is an open-drain output.
- Must not exceed t_{TD} minimum. See Table 1.
- RST remains within 0.5V of V_{CC} on power-down until V_{CC} drops below 2.0V. \overline{RST} remains within 0.5V of GND on power-down until V_{CC} drops below 2.0V.
- Watchdog can not be disabled. It must be strobed to avoid resets.
