## 74HC4053; 74HCT4053

## Triple 2-channel analog multiplexer/demultiplexer

## 1. General description

The 74 HC 4053 ; 74 HCT 4053 is a high-speed Si-gate CMOS device and is pin compatible with the HEF4053B. It is specified in compliance with JEDEC standard no. 7A.

The 74HC4053; 74HCT4053 is triple 2-channel analog multiplexer/demultiplexer with a common enable input ( $\overline{\mathrm{E}}$ ). Each multiplexer/demultiplexer has two independent inputs/outputs ( $\mathrm{n} Y 0$ and nY 1 ), a common input/output ( nZ ) and three digital select inputs (Sn).

With $\bar{E}$ LOW, one of the two switches is selected (low-impedance ON-state) by S1 to S3. With $\bar{E}$ HIGH, all switches are in the high-impedance OFF-state, independent of S1 to S3.
$V_{C C}$ and GND are the supply voltage pins for the digital control inputs (S1 to S3 and $\overline{\mathrm{E}}$ ). The $\mathrm{V}_{\mathrm{CC}}$ to GND ranges are 2.0 V to 10.0 V for 74 HC 4053 and 4.5 V to 5.5 V for 74 HCT 4053 . The analog inputs/outputs ( $\mathrm{nY0}$ and nY 1 , and $n Z$ ) can swing between $\mathrm{V}_{\mathrm{Cc}}$ as a positive limit and $\mathrm{V}_{\mathrm{EE}}$ as a negative limit. $\mathrm{V}_{\mathrm{CC}}-\mathrm{V}_{\mathrm{EE}}$ may not exceed 10.0 V .

For operation as a digital multiplexer/demultiplexer, $\mathrm{V}_{\mathrm{EE}}$ is connected to GND (typically ground).

[1] To avoid drawing $\mathrm{V}_{\mathrm{cc}}$ current out of terminals nZ , when switch current flows in terminals nYn , the voltage drop across the bidirectional switch must not exceed 0.4 V . If the switch current flows into terminals $n Z$, no $V_{C C}$ current will flow out of terminals $n Y n$. In this case there is no limit for the voltage drop across the switch, but the voltages at $n Y n$ and $n Z$ may not exceed $V_{C C}$ or $V_{E E}$.
[2] For DIP16 package: $P_{\text {tot }}$ derates linearly with $12 \mathrm{~mW} / \mathrm{K}$ above $70^{\circ} \mathrm{C}$.
[3] For SO16 package: $P_{\text {tot }}$ derates linearly with $8 \mathrm{~mW} / \mathrm{K}$ above $70^{\circ} \mathrm{C}$.
[4] For SSOP16 and TSSOP16 packages: $P_{\text {tot }}$ derates linearly with $5.5 \mathrm{~mW} / \mathrm{K}$ above $60^{\circ} \mathrm{C}$.
[5] For DHVQFN16 packages: $\mathrm{P}_{\text {tot }}$ derates linearly with $4.5 \mathrm{~mW} / \mathrm{K}$ above $60^{\circ} \mathrm{C}$.

[1] At supply voltages $\left(\mathrm{V}_{\mathrm{CC}}-\mathrm{V}_{\mathrm{EE}}\right)$ approaching 2.0 V the analog switch ON resistance becomes extremely non-linear. Therefore, it is recommended that these devices be used to transmit digital signals only, when using these supply voltages.
