## APPLICATION INFORMATION

### Input Decoupling

A 1.0  $\mu\text{F}$  tantalum capacitor is the recommended value to be connected between  $V_{\text{in}}$  and GND. For PCB layout considerations, the traces of  $V_{\text{in}}$  and GND should be sufficiently wide in order to minimize noise and prevent unstable operation.

### Output Decoupling

It is recommended to use a 2.2  $\mu\text{F}$  or higher tantalum capacitor on the  $V_{\text{out}}$  pin. For better performance, select a capacitor with low Equivalent Series Resistance (ESR). For PCB layout considerations, place the output capacitor close to the output pin and keep the leads short as possible.
