Dual retriggerable monostable multivibrator with reset

Product data sheet

1. General description

The 74HC123; 74HCT123 are high-speed Si-gate CMOS devices and are pin compatible with Low-power Schottky TTL (LSTTL). They are specified in compliance with JEDEC standard no. 7A.

The 74HC123; 74HCT123 are dual retriggerable monostable multivibrators with output pulse width control by three methods:

1. The basic pulse time is programmed by selection of an external resistor (R_{EXT}) and capacitor (C_{EXT}).
2. Once triggered, the basic output pulse width may be extended by retriggering the gated active LOW-going edge input ($n\bar{A}$) or the active HIGH-going edge input (nB). By repeating this process, the output pulse period ($nQ = HIGH$, $n\bar{Q} = LOW$) can be made as long as desired. Alternatively an output delay can be terminated at any time by a LOW-going edge on input $n\bar{RD}$, which also inhibits the triggering.
3. An internal connection from $n\bar{RD}$ to the input gates makes it possible to trigger the circuit by a HIGH-going signal at input $n\bar{RD}$ as shown in the function table.

Schmitt-trigger action in the $n\bar{A}$ and nB inputs, makes the circuit highly tolerant to slower input rise and fall times.

The 74HC123; 74HCT123 is identical to the 74HC423; 74HCT423 but can be triggered via the reset input.

2. Features

- DC triggered from active HIGH or active LOW inputs
- Retriggerable for very long pulses up to 100 % duty factor
- Direct reset terminates output pulse
- Schmitt-trigger action on all inputs except for the reset input
- ESD protection:
 - ◆ HBM EIA/JESD22-A114-C exceeds 2000 V
 - ◆ MM EIA/JESD22-A115-A exceeds 200 V
- Specified from -40°C to $+85^{\circ}\text{C}$ and from -40°C to $+125^{\circ}\text{C}$

- [1] For other R_{EXT} and C_{EXT} combinations see [Figure 7](#). If $C_{EXT} > 10 \text{ nF}$, the next formula is valid.

$$t_w = K \times R_{EXT} \times C_{EXT}, \text{ where:}$$

t_w = typical output pulse width in ns;

R_{EXT} = external resistor in $\text{k}\Omega$;

C_{EXT} = external capacitor in pF;

K = constant = 0.45 for $V_{CC} = 5.0 \text{ V}$ and 0.55 for $V_{CC} = 2.0 \text{ V}$.

The inherent test jig and pin capacitance at pins 15 and 7 (nREXT/CEXT) is approximately 7 pF.

- [2] The time to retrigger the monostable multivibrator depends on the values of R_{EXT} and C_{EXT} . The output pulse width will only be extended when the time between the active-going edges of the trigger input pulses meets the minimum retrigger time. If $C_{EXT} > 10 \text{ pF}$, the next formula (at $V_{CC} = 5.0 \text{ V}$) for the setup time of a retrigger pulse is valid:

$$t_{rt} = 30 + 0.19 \times R_{EXT} \times C_{EXT}^{0.9} + 13 \times R_{EXT}^{1.05}, \text{ where:}$$

t_{rt} = retrigger time in ns;

C_{EXT} = external capacitor in pF;

R_{EXT} = external resistor in $\text{k}\Omega$.

The inherent test jig and pin capacitance at pins 15 and 7 (nREXT/CEXT) is 7 pF.

- [3] When the device is powered-up, initiate the device via a reset pulse, when $C_{EXT} < 50 \text{ pF}$.

- [4] C_{PD} is used to determine the dynamic power dissipation (P_D in μW).
 $P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum(C_L \times V_{CC}^2 \times f_o) + 0.75 \times C_{EXT} \times V_{CC}^2 \times f_o + D \times 16 \times V_{CC}$ where:
 f_i = input frequency in MHz;
 f_o = output frequency in MHz;
 D = duty factor in %;
 C_L = output load capacitance in pF;
 V_{CC} = supply voltage in V;
 C_{EXT} = timing capacitance in pF;
 $\sum(C_L \times V_{CC}^2 \times f_o)$ sum of outputs.
- [5] The condition is $V_I = \text{GND}$ to V_{CC} .
