

Dual non-retriggerable monostable multivibrator with reset

74HC/HCT221

FEATURES

- Pulse width variance is typically less than $\pm 5\%$
- Pin-out identical to "123"
- Overriding reset terminates output pulse
- nB inputs have hysteresis for improved noise immunity
- Output capability: standard (except for nR_{EXT}/C_{EXT})
- I_{CC} category: MSI

GENERAL DESCRIPTION

The 74HC/HCT221 are high-speed Si-gate CMOS devices and are pin compatible with low power Schottky TTL (LSTTL). They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT221 are dual non-retriggerable monostable multivibrators. Each multivibrator features an active LOW-going edge input (n \bar{A}) and an active HIGH-going edge input (nB), either of which can be used as an enable input.

Pulse triggering occurs at a particular voltage level and is not directly related to the transition time of the input pulse. Schmitt-trigger input circuitry for the nB inputs allow

jitter-free triggering from inputs with slow transition rates, providing the circuit with excellent noise immunity.

Once triggered, the outputs (nQ, n \bar{Q}) are independent of further transitions of n \bar{A} and nB inputs and are a function of the timing components. The output pulses can be terminated by the overriding active LOW reset inputs (n \bar{R}_D). Input pulses may be of any duration relative to the output pulse.

Pulse width stability is achieved through internal compensation and is virtually independent of V_{CC} and temperature. In most applications pulse stability will only be limited by the accuracy of the external timing components.

The output pulse width is defined by the following relationship:

$$t_W = C_{EXT}R_{EXT} \ln 2$$

$$t_W = 0.7C_{EXT}R_{EXT}$$

Pin assignments for the "221" are identical to those of the "123" so that the "221" can be substituted for those products in systems not using the retrigger by merely changing the value of R_{EXT} and/or C_{EXT}.

QUICK REFERENCE DATA

GND = 0 V; T_{amb} = 25 °C; t_r = t_f = 6 ns

SYMBOL	PARAMETER	CONDITIONS	TYPICAL		UNIT
			HC	HCT	
t _{PHL}	propagation delay n \bar{A} , nB, n \bar{R}_D to nQ, n \bar{Q}	C _L = 15 pF; V _{CC} = 5 V; R _{EXT} = 5 k Ω ; C _{EXT} = 0 pF	29	32	ns
t _{PLH}	n \bar{A} , nB, n \bar{R}_D to nQ, n \bar{Q}		35	36	ns
C _I	input capacitance		3.5	3.5	pF
C _{PD}	power dissipation capacitance per package	notes 1 and 2	90	96	pF

Notes

1. C_{PD} is used to determine the dynamic power dissipation (P_D in μ W):

$$P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum (C_L \times V_{CC}^2 \times f_o) + 0.33 \times C_{EXT} \times V_{CC}^2 \times f_o + D \times 28 \times V_{CC} \quad \text{where:}$$

f_i = input frequency in MHz; f_o = output frequency in MHz

$\sum (C_L \times V_{CC}^2 \times f_o)$ = sum of outputs

C_{EXT} = timing capacitance in pF; C_L = output load capacitance in pF

V_{CC} = supply voltage in V; D = duty factor in %

2. For HC the condition is V_I = GND to V_{CC}
For HCT the condition is V_I = GND to V_{CC} - 1.5 V

Dual non-retriggerable monostable multivibrator with reset
