Dual retriggerable monostable multivibrator with reset

Product data sheet

## 1. General description

74HC423; 74HCT423 are high-speed Si-gate CMOS devices that are pin compatible with low power Schottky TTL (LSTTL). They are specified in compliance with JEDEC standard no. 7A.

The 74HC423; 74HCT423 dual retriggerable monostable multivibrator with reset has two methods of output pulse width control.

1. The minimum pulse width is essentially determined by the selection of an external resistor ( $R_{EXT}$ ) and capacitor ( $C_{EXT}$ ), see [Section 12.1](#).
2. Once triggered, the basic output pulse width may be extended by retriggering the gated active LOW-going edge input ( $n\bar{A}$ ) or the active HIGH-going edge input ( $nB$ ). By repeating this process, the output pulse period ( $nQ = \text{HIGH}$ ,  $n\bar{Q} = \text{LOW}$ ) can be made as long as desired. When  $n\bar{R}D$  is LOW, it forces the  $nQ$  output LOW, the  $n\bar{Q}$  output HIGH and also inhibits the triggering. [Figure 10](#) and [Figure 11](#) illustrate pulse control by reset.

The  $n\bar{A}$  and  $nB$  inputs' Schmitt trigger action makes them highly tolerant to slower input rise and fall times.

The 74HC423; 74HCT423 are identical to the 74HC123; 74HCT123 except that they cannot be triggered via the reset input.

[1] t<sub>pd</sub> is the same as t<sub>PHL</sub> and t<sub>PLH</sub>.[2] t<sub>t</sub> is the same as t<sub>T<sub>HL</sub></sub> and t<sub>T<sub>LH</sub></sub>.[3] For other R<sub>EXT</sub> and C<sub>EXT</sub> combinations see [Figure 8](#). If C<sub>EXT</sub> > 10 pF, the next formula is valid:t<sub>w</sub> = K × R<sub>EXT</sub> × C<sub>EXT</sub> (typ.), where:t<sub>w</sub> = output pulse width in ns;R<sub>EXT</sub> = external resistor in kΩ;C<sub>EXT</sub> = external capacitor in pF;K = 0.55 for V<sub>CC</sub> = 2.0 V and 0.45 for V<sub>CC</sub> = 5.0 V; see [Figure 9](#).

Inherent test jig and pin capacitance at pins 15 and 7 (nREXT/CEXT) is 7 pF.

[4] The time to retrigger the monostable multivibrator depends on the values of R<sub>EXT</sub> and C<sub>EXT</sub>. The output pulse width will only be extended when the time between the active-going edges of the trigger input pulses meets the minimum retrigger time.If C<sub>EXT</sub> > 10 pF, the next formula (at V<sub>CC</sub> = 5.0 V) for the set-up time of a retrigger pulse is valid:t<sub>r<sub>trig</sub></sub> = 30 + 0.19 × R<sub>EXT</sub> × C<sub>EXT</sub><sup>0.9</sup> + 13 × R<sub>EXT</sub><sup>1.05</sup> (typ.); where:t<sub>r<sub>trig</sub></sub> = retrigger time in ns;C<sub>EXT</sub> = external capacitor in pF;R<sub>EXT</sub> = external resistor in kΩ.

Inherent test jig and pin capacitance at pins 15 and 7 (nREXT/CEXT) is 7 pF.

[5] When the device is powered-up, initiate the device via a reset pulse, when C<sub>EXT</sub> < 50 pF.[6] C<sub>PD</sub> is used to determine the dynamic power dissipation (P<sub>D</sub> in μW):P<sub>D</sub> = C<sub>PD</sub> × V<sub>CC</sub><sup>2</sup> × f<sub>i</sub> × N + Σ (C<sub>L</sub> × V<sub>CC</sub><sup>2</sup> × f<sub>o</sub>); where:f<sub>i</sub> = input frequency in MHz;f<sub>o</sub> = output frequency in MHz;C<sub>L</sub> = output load capacitance in pF;V<sub>CC</sub> = supply voltage in V;

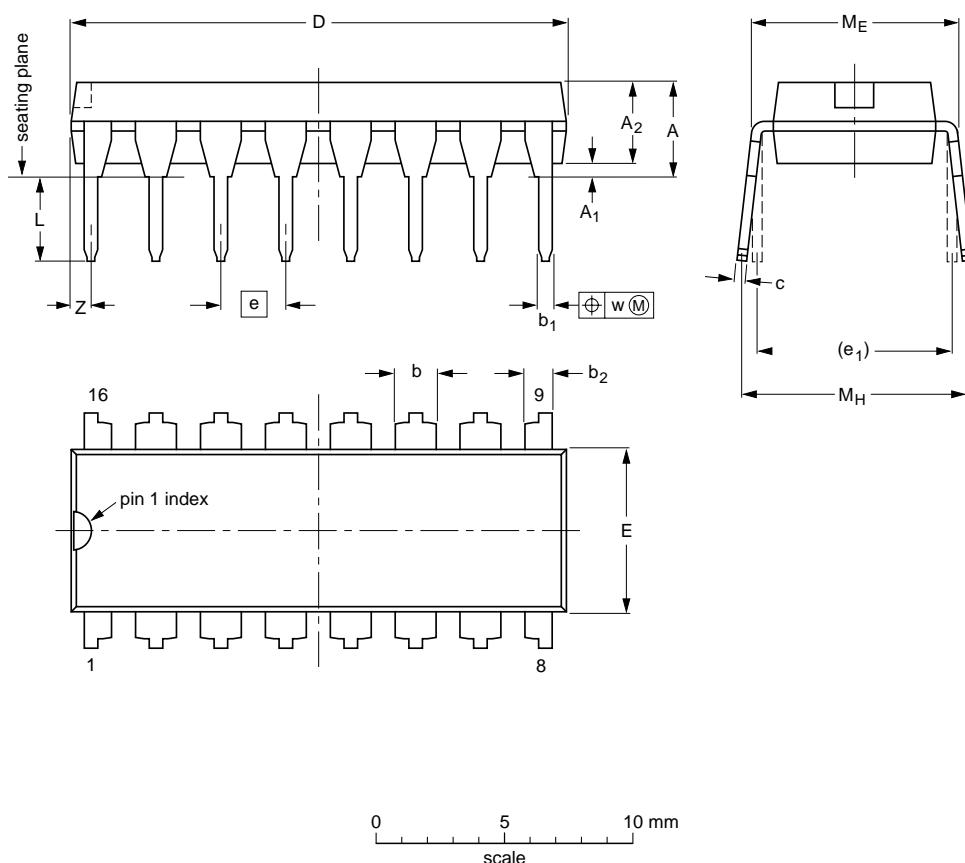

N = number of inputs switching;

Σ (C<sub>L</sub> × V<sub>CC</sub><sup>2</sup> × f<sub>o</sub>) = sum of outputs.
