This is the value that measured on measuring board with capacitor of 22 µ F at 150mm from output terminal. *1

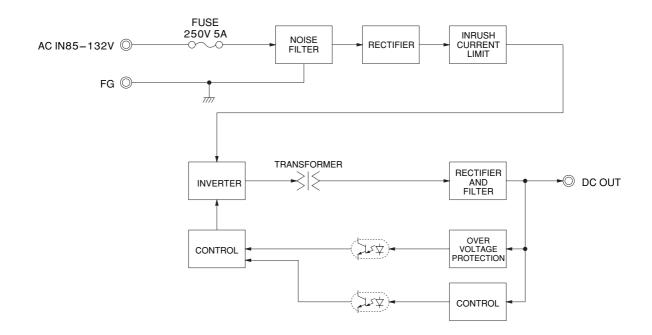

Measured by 20MHz oscilloscope or Ripple-Noise meter (Equivalent to KEISOKU-GIKEN: RM-103). Drift is the change in DC output for an eight hour period after a half-hour warm-up at 25°C, with the input voltage held constant at the rated input/output. *2 *3 Peak loading for 10sec.And Duty 35% max.or less is acceptable if the total wattage is less than the rated wattage.

Refer to instruction Manual 5. In detail. Avoid prolonged use under over - load. Parallel operation with other model is not possible.

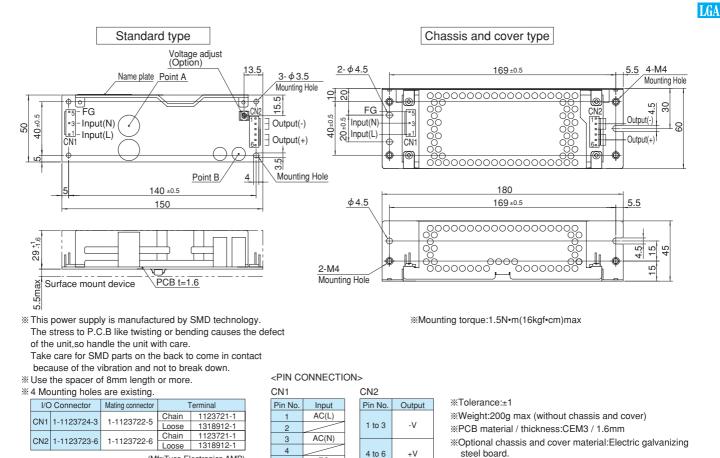

Derating is required when operated with chassis and cover. A sound may occur from power supply at pulse loading.
